#### RESEARCH EXPERIENCE

#### Cervical Cytological Image Synthesis for Cervical Lesion Screening

2022 - 2024

- Proposed CellGAN, a conditional GAN that generates cytological images of various cervical cell types including NILM, ASC-US, ASC-H, LSIL, and HSIL cells for augmenting patch-level cervical cell classification.
- Incorporated CellGAN into a knowledge distillation framework for multi-class abnormal cervical cell detection, which facilitates the class-balance pre-training of a teacher network.
- One paper accepted by MICCAI 2023 (early accept); one paper accepted by Neural Networks.

### Chest X-ray Lung Nodule Synthesis for Lung Nodule Detection

2020 - 2022

- Proposed an inpainting-based lung nodule synthesis network and a classification-based sample selection network to select effective synthetic samples for augmenting lung nodule detection.
- Proposed a lung nodule synthesis framework that disentangles nodule attributes (*i.e.*, shape, size, and texture) and synthesize nodules in a controllable manner. Leveraged the controllability of the framework to design a hard example mining strategy for data augmentation on lung nodule detection.
- One paper accepted by *PRCV 2021*; one paper accepted by *Medical Image Analysis*.

# Cross-Modality PET Image Synthesis for Parkinson's Disease (PD) Diagnosis

2023 - 2024

- Propose a two-stage framework that synthesizes <sup>11</sup>C-CFT PET images from real <sup>18</sup>F-FDG PET scans for automatic PD diagnosis, which was based on the correlation between dopaminergic deficiency in the striatum and increased glucose metabolism in PD patients.
- Proposed a Metabolism-aware Anomaly Detection (MetaAD) framework, which leverages a cyclic modality translation workflow to identify metabolism anomalies of PD in <sup>18</sup>F-FDG PET scans.
- One paper accepted by MICCAI 2024 (early accept); one paper submitted to npj Digital Medicine (under review).

### MR Image Super-resolution for Arbitrary Inter-slice Spacing Reduction

2022 - 2023

- Proposed HiFi-Diff, a diffusion-based MRI super-resolution model for arbitrary inter-slice spacing reduction, which generates any desired in-between MR slice from hierarchical features of adjacent MR slices.
- Proposed SA-INR, which represents an MR image as a continuous implicit function of 3D coordinates and performs arbitrary inter-slice spacing by sampling the coordinates in 3D space.
- One paper accepted by **MLMI 2023**; one paper accepted by **Medical Image Analysis**.
